(I)

TECHNICAL FIELD

The present invention relates to 2-arylthiazole derivatives or their pharmaceutically acceptable salts, and pharmaceutical compositions containing the same, and in particular, to the use thereof for treating gout or hyperuricemia, or diseases associated with a production of interleukin 1.

BACKGROUND ART

It is recognized that human beings among animals, especially adult men, suffer from gout derived from hyperuricemia, including a lesion of renal stroma, blood vessels, urinary calculus, acute arthritis and gouty tophus caused by lithogenesis.

In the treatment of the gout, colchicine or a non-steroidal anti-inflammatory drug is used during the acute arthritic attack, and an hypouricemic therapy for hyperuricemia is conducted after a remission of the attack. The therapeutic agent for hyperuricemia is roughly classified into a uricosuric accelerator and a uricopiasis inhibitor, which can be properly selected depending upon the conditions and severity of diseases. Examples of the former include probenecid and benzbromarone. Allopurinol, which is a structural isomer of hypoxanthine, has long been used as the latter. Allopurinol inhibits xanthine oxidase and prevents the formation of uric acid from hypoxanthine and xanthine, to thus lower the serum uric acid level. Although the enzyme inhibitors of this type have been widely studied, using xanthine derivatives in the main, no drug has yet been found to safety requirements, and only allopurinol is applied to alleviate gout. Japanese Unexamined Patent Publication (Kokai) Nos. 57-85379 and 59-95272 disclose that isothiazole and a pyrazole derivatives inhibit xanthine oxidase to lower the serum uric acid level in mammal, but to date, none are in use for clinical applications.

On the other hand, a variety of 2-arylthiazole derivatives, and their synthetic intermediates has been proposed to have various physiological activities such as anti-inflammatory, analgesic, antimicrobial and antitumor activities, and inhibitory activity for prolyle or lysylehydroxylase. Also, it is known that 2-arylthiazole derivatives are used in the dye art. Among the known compounds, 2-arylthiazole derivatives having a methylcarboxyl group ($-\text{CH}_2\text{COOH}$ or its ester) at the 5- or 4-position of the thiazole ring have found to possess anti-inflammatory or analgesic action, the compounds are studied in the art (see, for example, Spanish Patent No. 499110, GB Patent No. 687981 or Japanese Examined Patent Publication (Kokoku) No. 43-19307, GB Patent No. 1137529 or Japanese Examined Patent Publication (Kokoku) No. 47-41353, GB Patent No. 1145884 or Japanese Examined Patent Publication (Kokoku) No. 49-38267, DE-A-1917432 or Japanese Examined Patent Publication (Kokoku) No. 47-7368, GB Patent No. 1574583, BE Patent No. 888252). In synthetic intermediates or final products of the other physiologically active substances or dyes, there are included 2-arylthiazole derivatives having a carboxyl group, or either an ester or amide group derived from same at a 4- or 5- position in a thiazole ring thereof, for example, A. Benko et al., *Chem. Ber.* 100, (1967) 7, 2184-87, discloses 4-methyl-2-phenyl-5-thiazolecarboxylic acid and m-nitro or p-nitro substituted compounds on a phenyl group thereof; DE-A-3026054 or Japanese Examined Patent Publication (Kokoku) No. 63-10701, and Japanese Examined Patent Publication (Kokoku) No. 63-10950 disclose 2-phenyl-5-thiazolecarboxylic acid derivatives in which the 2-phenyl moiety has three methoxy groups for antiulcer; DE-A-1959307 discloses a variety of dyes prepared from 2-phenyl-5-thiazole carboxylic acid as a starting material; DE-A-3141430, DE-A-2125193 and DE-A-2125251 disclose 2-phenyl-5-thiazolecarboxylic acid derivatives in which the 2-phenyl moiety is tri-substituted by nitro, amino and azo groups, as used for dye and synthetic intermediates thereof; US Patent No. 3518279 discloses, as used for synthetic intermediates of an insecticide, 2-phenyl-5-thiazolecarboxylic acid derivatives in which the 2-phenyl moiety has substituent(s) such as a halogen atom, lower-alkyl, alkoxy, alkylamino or acylamino group, and further, has a carboxylic ester residue at a 5-position of same; and DE-C-3002989 discloses 2-phenyl-4-thiazole-carboxylic acid derivatives in which the 2-phenyl moiety has a hydroxyl group at a 2'-position, a hydrogen atom, methyl group, halogen atom, nitro group, amino group or sulfonamide group at a 3'- or 5'-position, and a hydrogen atom, hydroxyl or methyl group at a 4'-position of same, as an inhibitor of prolyle- or lysyle-hydroxylase.

Furthermore, in a synthetic investigation of thiazole derivatives, 2-aryl-5-thiazolecarboxylic acid derivatives are disclosed as intermediates (for example, *Arch. Pharm. (Weinheim)* 309 (1976) 2, 128-130).

Nevertheless, in the prior arts, it is neither described nor suggested that each disclosed 2-arylthiazole derivative has a xanthine oxidase inhibitory activity or uric acid-decreasing activity, or an inhibitory activity to production of interleukin 1 or arthritis associated with a production of same.

DISCLOSURE OF THE INVENTION

The present inventors have made extensive and intensive researches into the provision of a useful compound for a xanthine oxidase inhibitor, from a different viewpoint to that of prior investigations into the inhibitor, and as a result, have accomplished the present invention based upon a finding that some 2-arylthiazole derivatives have a high xanthine oxidase inhibitory activity or uric acid decreasing action, and thus are efficacious against gout or hyperuricemia, and further, have a high inhibitory activity against the production of interleukin 1.

Therefore, in accordance with the present invention, pharmaceutical compositions comprising an effective amount of a 2-arylthiazole derivative having the following formula (I) or pharmaceutically acceptable salt thereof for treating diseases selected from a group consisting of gout or hyperuricemia and diseases associated with a production of interleukin 1, are provided:

Parts of the compounds hereinbefore set forth are well known in the art, and the novel compounds according to the present invention may be produced as a process of producing the known compound.

For example, the compounds can be generally prepared by known procedures as described in Organic Reactions, Vol. 6, 367-409(1951), or Heterocyclic Compounds, Vol. 34, (1978). Further, when Ar is represented by the formula (II), the compounds can be produced by the following process:

wherein R_1 , R_2 and R_3 are as defined above in connection with the formula (II), Y is as defined above in connection with the formula (I), Hal represents a halogen atom, and R_a represents a C_{1-4} alkyl group.

Specifically, a substituted thiobenzamide and an alkyl ester of 2-halogeno-acetylacetic acid are directly mixed or reacted with in solvent in the presence or absence of a base at a temperature in the range of room temperature to 200°C , preferably in the range of 50 to 100°C . Examples of the base include organic bases, such as triethylamine, pyridine and dimethylaminopyridine, and inorganic bases, such as anhydrous potassium carbonate and sodium hydroxide. The solvent may be any one as long as it has no adverse effect on the reaction, and examples thereof include hydrocarbons such as benzene, toluene and hexane, ethers such as dioxane and methylcellosolve, alcohols such as ethanol and isopropanol, and N,N-dimethylformamide, dimethylsulfoxide and acetonitrile. Among them, alcohols corresponding to the substituent R_a are preferred. The resultant ester derivative is hydrolyzed by a conventional process to provide a corresponding free acid.

The substituted thiobenzamide derivative is usually produced by adding phosphorus pentasulfide or a lawson reagent (see Bull. Soc. Chim. Belg. 87, 223 (1978)) from a corresponding benzamide in a solvent such as benzene.

It is also known that thiobenzamide is synthesized by adding hydrogen sulfide from a corresponding benzonitrile (see A.E.S. Fairfull et al., J. Chem. Soc., 1952, 742). Note, the addition of thioacetamide in N,N-dimethylformamide saturated with hydrochloric acid followed by heating (see E.C. Taylor et al., J. Am. Chem. Soc., 82, 2656 (1960)) is preferred from the viewpoint of yield, operating property and economy.

When a thiazole ring is formed, as described in Organic Synthesis III, 332 (1955) and Japanese Patent

No. JP87055, an α -haloketone derivative may be allowed to react without isolation of a thioamide derivative or a thiobenzamide derivative.

When Ar is represented by a group other than the formula (II), an intended product can be produced in the same manner as that described above.

If necessary, the 2-aryl-5-thiazolecarboxylic acid derivative thus produced is converted to a salt thereof with a pharmaceutically acceptable non-toxic cation. Examples of this kind of cation include alkali metal cations such as Na and K, alkaline earth metal cations such as Mg and Ca, other metal cations used usually, such as Al and Zn and organic bases such as ammonia, triethylamine and pyridine. When the compounds represented by the formula (I) have an amino group in its molecule, they can be converted to corresponding acid addition salts. Examples of the acid include mineral acids such as hydrochloric acid, sulfuric acid and nitric acid and pharmaceutically acceptable organic acids such as acetic acid, benzoic acid, fumaric acid, maleic acid, methanesulfonic acid, toluenesulfonic acid or amino acids such as glycine and alanine.

The compounds produced in the present invention are provided in the form of oral preparations such as soft capsule, hard capsule, tablet, granule, powder, suspension, solution and syrup, injections, suppositories and external preparations by a conventional method through the use of a suitable excipient or the like. Examples of the excipient include vegetable oils (for example, corn oil, cotton seed oil, coconut oil, almond oil, peanut oil, olive oil, and the like), oily esters such as medium-length chain fatty acid glyceride oil, mineral oils, glycerin esters such as tricaprylin, triacetin, and the like, alcohols such as ethanol, and the like, physiological saline, propylene glycol, polyethylene glycol, petrolatum, animal fat and oil, cellulose derivatives (crystalline cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose, methyl cellulose), polyvinyl pyrrolidone, dextrin, lactose, mannitol, sorbitol, starch, and the like.

The dose of the active ingredient is usually about 1 to 500 mg/day/person, preferably 10 to 300 mg/day/person, and it is preferred for formulations to be conducted so as to satisfy such a requirement.

The present inventors have found that the 2-arylthiazole derivatives of the formula (I) have very high xanthine oxidase inhibitory activity and serum uric acid lowering activity against mammals and surprisingly have a strong interleukin 1 (IL-1) production inhibitory activity. IL-1 is known to induce the activation of leucocytes, the sthenia of production of an antibody, the sthenia of production of cytokine and PGE₂ from macrophage, the dissolution of bone, the fever, etc., and is considered to participate in chronic rheumatism, osteoarthritis, osteoporosis, tissue rejection, sepsis, toxicogenic shock syndrome, symptoms such as fever and respiratory diseases derived from infection of virus or bacteria (i.e., "influenza"), chronic nephritis, secondary cachexia derived from malignant infection, keloplasty, cicatrization, Crohn's disease, colitis ulcerosa, multiple sclerosis and crisis and evolution of a reverse or other reaction against dialysis.

Therefore, the 2-arylthiazole derivatives etc. according to the present invention can be used as a therapeutic agent for gout or hyperuricemia, an interleukin 1 production inhibitor and a therapeutic agent for the above-described chronic inflammatory diseases such as nephritis, hepatitis and arthritis. Further, they can be expected to exhibit, as an interleukin 1 production inhibitor, a therapeutic effect quite different from that of the conventional antifebriles and anti-inflammatory agents and anti-infectants.

50 Pharmacological Test 1 (in vitro determination)

(1) Preparation of test compounds:

55 Test compounds (compounds of Ex. No. listed in Table 1) were dissolved in dimethylsulfoxide and diluted with a 50 mM phosphate buffer to prepare aqueous solutions respectively having predetermined concentrations.

(2) Determining method:

45 nmol of xanthine and test compounds prepared so as to have various concentrations were added to 3 ml of a phosphate buffer having a pH value of 7.4 and containing 3 mU of xanthine oxidase (derived from a butter milk; available from Sigma Chemical Company). A reaction was allowed to proceed at 37°C, and the change in OD at 292 nm based on the formation of uric acid was measured with time through the use of a spectrophotometer U-3200 (manufactured by Hitachi, Limited) to determine the initial reaction rate. The inhibition rate was determined by the following equation:

$$\text{Inhibition (\%)} = \frac{(\text{initial rate of control}) - (\text{initial rate in the case where inhibitor was added})}{(\text{initial rate of control})} \times 100$$

The inhibition (%) was determined on each test compound prepared according to (1), and the IC₅₀ value on the xanthine oxidase (XOD) inhibition was calculated from the value of inhibition. The results are given in Table 1.

Pharmacological Test 2 (Determination of Oral Administration)

Test compounds suspended in a 5% gum arabic solution was forcibly administered by oral administration (compounds of Ex. No. of Table 2, dose: 1 mg/kg) to ICR male mice (age: about 7 weeks) (one group: 6 mice) by means of an oral probe. 2 hours after the administration, thoracotomy was conducted under etherization to collect blood from the heart, and serum was removed by a conventional process. The serum uric acid was measured by a biochemical automatic analyzer (Flexigem; Electro-Nucleonics, Inc.) by using a uric acid measurement kit (UA reagent; International Reagent) to determine the percentage of the lowering of uric acid.

Lowering in uric acid (%)

$$= \frac{(\text{uric acid level of control animal}) - (\text{uric acid level of test-compound-administration animal})}{\text{uric acid level of object animal}} \times 100$$

The results are given in Table 2.

Pharmacological Test 3 (Interleukin 1 Production Inhibitory Activity)

1 ml of a 5% oyster glycogen solution was intra-abdominally administered to a BALB/c mouse (male, 8 weeks in age), and 4 days after the administration, the infiltrated abdominal exuded cells were adhered to a plastic dish for 2 hours, and 1 μ g/ml of LPS was allowed to act on macrophage (1×10^6 cells). Interleukin 1 extricated on the supernatant in 24 hours was measured by an ELISA technique. The test compound (compounds of Ex. No. described in Table 3) was prepared so as to have a concentration of 10^{-6} M, and the interleukin 1 production inhibitory activity was expressed in terms of the percentage inhibition based on the amount of production of the control. The results are given in Table 3.

Pharmacological Test 4 (Collagen Arthritis Inhibitory Activity)

An emulsion comprising a bovine II type collagen and incomplete Freund's adjuvant in a proportion of 1 : 1 were intradermally injected to Lewis rats (male, about 6 weeks in age) (one group: 8 mice) at the region of the back so that the amount of antigen was 2 mg/rat, thereby inducing arthritis. The compound of Ex. No. 35 was suspended in a 5% gum arabic solution, and orally administered 5 times per week in two groups of 10 mg/kg and 50 mg/kg from the sensitized day. Only the gum arabic solution was administered to the control. Then 6 weeks after the sensitization, the percentage increase in the volume of the right foot was measured and expressed in terms of the percentage swelling, and the anti-collagen antibody titer of the serum was measured by the ELISA technique. The results are given in Table 4.

As can be seen from Table 5, the compound of the present invention inhibited the swelling of foot-pad depending upon the dose when administered in doses of 100 mg/kg and 50 mg/kg (the percentage

inhibitions were respectively 44.1% and 53.4%). Further, the compound of the present invention exhibited a tendency to inhibit the antibody titer of serum anti-collagen involved in the sideration of collagen arthritis in a group of administration in doses of 10 mg/kg and 50 mg/kg. The above-described facts suggest that there is a possibility that the compound of the present invention has an anti-arthritic activity and an anti-collagen-antibody is involved in one of the action mechanisms.
